

Generic Record Retrieval

This service returns some or all of the columns from a specific record from a specified table.

Method Name	get
Required Members	rxUserLogon rxPassword rxTable rxKey
Optional Members	rxIndex rxColumns
Returned Members	rxReturn rxMessage <columnNames>

rxUserLogon

This is the User Logon for the Sage MAS 90 (or MAS 200) ERP System.

rxPassword

This is the password for the user entered in userLogon.

rxTable

This is the Sage MAS 90 Business Framework file name without the M4T extension.

rxKey

This is the key for the record you want returned from the table above.

rxIndex

This is the name or number of the key to be used identifying the record.

rxColumns

This is a comma-delimited list of the columns you want returned. If left blank, then all the columns in the table are returned.

rxReturn

If the remote procedure fails, this member will be set to zero.

rxMessage

This member will contain the reason for failure.

<columnNames>

If rxColumns was not populated, the returned members will include every column in the rxTable. If rxColumns was populated with column names, just those columns listed will be returned.
